DEFLECTION

double electrostatic

x-plates		symmetrical
y-plates		symmetrical
Angle between x and y-traces		90 ± 1°
Angle between x-trace and horizontal axis of the face	⩽	5° *

If use is made of the full deflection capabilities of the tube the deflection plates will block part of the electron beam, hence a low impedance deflection plate drive is desirable.

x_2 to all other elements except x_1	$C_{x2(x1)}$	7 pF
y_1 to all other elements except y_2	$C_{y1(y2)}$	4 pF
y_2 to all other elements except y_1	$C_{y2(y1)}$	4 pF
x_1 to x_2	C_{x1x2}	2,2 pF
y_1 to y_2	C_{y1y2}	1,3 pF

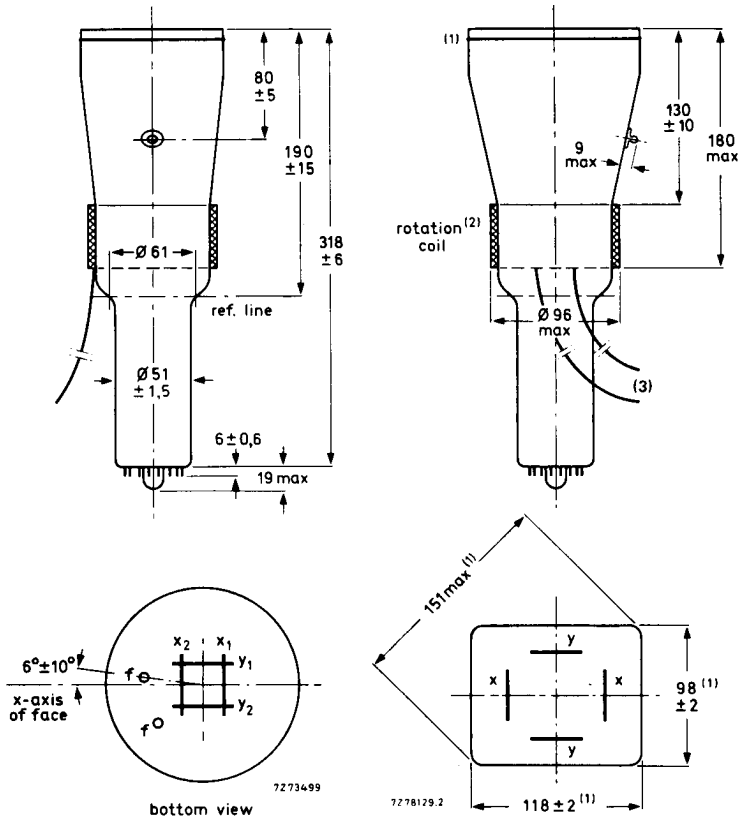
Cathode to all other elements	C_k	2,7 pF

* The tube is provided with a rotation coil, concentrically wound around the tube neck, enabling the alignment of the x-trace with the mechanical x-axis of the screen. The coil has 1000 turns and a resistance of max. 350 Ω. Under typical operating conditions, max. 35 ampere-turns are required for the max. rotation of 5°. This means the required current is max. 35 mA at a required voltage of max. 12 V.

DIMENSIONS AND CONNECTIONS

Dimensions in mm



(1) The bulge at the frit seal may increase the indicated maximum dimensions by not more than 2 mm.

(2) The coil is fixed to the envelope by means of adhesive tape.

(3) The length of the connecting leads of the rotation coil is min. 350 mm.

NOTES

1. The geometry control electrode voltage V_{g6} should be adjusted within the indicated range (values with respect to the mean x-plate potential).
2. The interplate shield voltage should be equal to the mean x-plate potential. The mean x-plate and y-plate potentials should be equal for optimum spot quality.
3. The astigmatism control electrode voltage should be adjusted for optimum spot shape. For any necessary adjustment its potential will be within the stated range.
4. The tube is designed for optimum performance when operating at a ratio $V_{g8(\ell)}/V_{g2,\,g4} = 5$. If this ratio is smaller than 5, the useful scan may be smaller than 100 mm x 80 mm.
5. Measured with the shrinking raster method in the centre of the screen with corrections adjusted for optimum spot size, at a beam current of 10 μA.
6. The sensitivity at a deflection of less than 75% of the useful scan will not differ from the sensitivity at a deflection of 25% of the useful scan by more than the indicated value.
7. A graticule consisting of concentric rectangles of 95 mm x 75 mm and 93 mm x 73 mm is aligned with the electrical x-axis of the tube. With optimum corrections applied, the edges of a raster will fall between these rectangles.
